

: 07 August 2019

As discussed we at RBS are absolutely astounded by the independently tested results of the NMR trial that we conducted at 250 Bishopsgate. It has shown that over the course of the year we have almost completely removed the rust and iron present in our Low Temperature Hot Water system. This will, in the future, avoid the huge costs of flushing and chemically cleaning our a/c systems that rely good flow through actuated valves , heat exchangers and heater batteries. We now intend to reduce our dependence on chemical inhibitors and will continue to monitor and analyse the results of this. We hope in the future to further install devices across our many closed water systems

Regards
